

Track your containers and freight

Create a Tracking job, print or attach the QR label, and let drivers update the journey as the freight moves.

No driver app or driver account required.

Movement records created by your people

The office sees submitted movements, recorded locations, waiting periods and exceptions in one journey history. Generate a report when a customer or colleague needs the record.

For containers, freight, hire equipment and other movable items. Tracking is optional and works alongside Service Sheet asset maintenance.

From \$2.99 + GST per job. Volume discounts available.

Current pricing: servicesheet.com.au/solutions/tracking

From job to journey record

1 CREATE

The office creates one Tracking job or a batch, with an item identifier, customer and optional references.

2 PRINT / ATTACH QR

Select jobs, choose a label format, preview and download the PDF. Attach the QR to the item or job documentation. Reprints use no additional credits.

3 PREPARE AND SCAN

Prepare the job before use. In Standard mode this reserves one credit. The driver scans the QR or enters its Tracking Code; no driver account is needed.

4 UPDATE

Record a movement such as collected, arrived, delivered or dehiored. Add relevant notes or exceptions. With permission, the phone supplies location for that update.

5 TRACK

The first movement starts the 90-day period. The office reviews events and history. Device location is optional; this is not continuous live tracking.

6 REPORT

Download the existing Tracking report with milestones, chronological history, waiting records and evidence references.

Demonstration: Port Botany to Smithfield

MSCU 1234567 (synthetic): 8:05 collected; 8:42 arrived; 9:18 delivered; 10:03 dehiored after return. These are illustrative submitted events, not a live journey.

The following sample is generated by the application's real report renderer. All names, identifiers, locations and times are demonstration data.

Recorded by: Driver QR / Tracking Code

About this record

Service Sheet does not independently or continuously track freight, containers or equipment. Records are created by user scans, Tracking Code entries and manual organisation entries. Location and timing depend on those actions and on device accuracy and availability.
